

1. Michael places a mirror on the ground 40.5 feet from the base of a geyser. He walks backward until he can see the top of the geyser in the middle of the mirror. At that point, Michael's eyes are 6 feet above the ground and he is 7 feet from image in the mirror. Use similar triangles to find the height of the geyser.

$$\frac{6}{7} = \frac{x}{40.5}$$

$$7x = 6(40.5)$$
$$\frac{7x}{7} = \frac{243}{7}$$
$$x = 34.7 \text{ ft}$$

2. Determine whether the polygons are similar. If so, write a similarity statement and give the scale factor. If not, explain.

$$n m o \sim B A C$$

$$1:0.4$$

$$\frac{3}{7.5} = 0.4$$

$$\frac{4}{10} = 0.4$$

$$\frac{5}{12.5} = 0.4$$

$$2:0.5$$

$$2:5$$

$$\frac{2}{5}$$

3. Solve for x . The triangles in each pair are similar.

$$\triangle MLK \sim \triangle HGF$$

$$\frac{9}{36} = \frac{2x-2}{32}$$

$$9(32) = 36(2x-2)$$

$$288 = 72x - 72$$

$$+ 72$$

$$+ 72$$

$$\frac{360}{72} = \frac{72x}{72} \quad x = 5$$

Learning Goal: Today I will learn how to simplify radicals.

Success Criteria: I am able to break a number into its factors and simplify a radical.

Simplifying Radicals

Simplifying Radicals

$\sqrt{\quad}$ = Radical Symbol

$\sqrt{9}$ ← Radicand

Square Root of a Number:

A number that when multiplied by itself equals the radicand.

Example: $3^2 = 9$ and $(-3)^2 = 9$, so 3 and -3 are **BOTH** square roots of 9

THE PERFECT SQUARE LIST...KNOW IT!

$1^2 = 1$	$\sqrt{1} = 1$	$9^2 = 81$	$\sqrt{81} = 9$
$2^2 = 4$	$\sqrt{4} = 2$	$10^2 = 100$	$\sqrt{100} = 10$
$3^2 = 9$	$\sqrt{9} = 3$	$11^2 = 121$	$\sqrt{121} = 11$
$4^2 = 16$	$\sqrt{16} = 4$	$12^2 = 144$	$\sqrt{144} = 12$
$5^2 = 25$	$\sqrt{25} = 5$	$13^2 = 169$	$\sqrt{169} = 13$
$6^2 = 36$	$\sqrt{36} = 6$	$14^2 = 196$	$\sqrt{196} = 14$
$7^2 = 49$	$\sqrt{49} = 7$	$15^2 = 225$	$\sqrt{225} = 15$
$8^2 = 64$	$\sqrt{64} = 8$		

Simplifying Radicals

RULES

- 1) No perfect squares other than 1 are in the radicand
- 2) No fractions are in the radicand
- 3) No radicals in the denominator

Steps to Simplifying Radicals:

$$\sqrt[2]{96}$$

Step 1: Using a tree or pyramid, find all the prime factors of the radicand. (Prime Factorization)

What 2 numbers do you multiply together to get 96?

If you can't think of one and it ends in an even number, use 2

$$4 \sqrt{6}$$

Step 2: Bring the pairs out (2 become 1). These are your repeaters. Only use the broken down numbers!

We have 5 2's so 4 of them will be repeater. Multiply them together. You do not have another 3, so it stays under the radical like the 2 that does not have a partner.

$$2 \ 2 \ 2 \ 2 \ 2 \ 3$$

Step 3: All values inside and outside are multiplied.

$$4\sqrt{6}$$

What if the number is really large?

$$\sqrt{945}$$

Handwritten work for simplifying $\sqrt{945}$:

945
